Cognitive Neuroscience Program

The Graduate Program in Cognitive Neuroscience is a competitive doctoral training program in the College of Natural Sciences at Colorado State University. The goal of the Program is to prepare students for careers of excellence in neuroscience research and teaching. Cognitive Neuroscience is an active and growing discipline at Colorado State University involving researchers in departments across campus.

Cognitive Neuroscience (CN) represents an exciting and rapidly expanding field. Graduate training in CN provides students with the opportunity to develop a close and collaborative relationship with their primary advisor. Incoming students are assigned to a particular faculty member (or members) based on mutual research interests. At the present time, CN faculty members have active research programs in the areas of developmental neuroscience, biological psychology, clinical neuroscience, and cognitive neuroscience of timing, learning and memory. The range of faculty interests allows broad instruction across the field of neuroscience and advanced training in specialized areas.

Program Objectives

The graduate program in Cognitive Neuroscience was built around the ideals of high-quality education and training in advanced research. The faculty in Cognitive Neuroscience and graduate students meet regularly to discuss current and ongoing research. An early

emphasis on laboratory research allows graduate students in the Program the opportunity to rapidly participate in the exciting process of disseminating their research findings to the larger scientific community. The general goal of the Program is to prepare students for productive research and teaching positions in the traditional academic setting and research scientist positions in government and industry. This training goal is achieved through coursework, research experience, teaching experience, and scholarly activities within and outside the Program.

All students in the Cognitive Neuroscience Program develop skills and sophistication in research methods, experimental design, and statistical analysis by completion of courses during their first year of graduate study. Additional coursework in the form of CN core courses provides a comprehensive foundation in neuroscience; and additional core courses outside the Program provide exposure to other fields of psychology. Specialization within neuroscience is achieved through participation in advanced seminars and active involvement in research. Since the goal of the faculty is to foster a student's development from novice to collaborator, students are expected to be actively engaged in research throughout their training.

Graduate student interdisciplinary research is encouraged. Collaborations with faculty in departments such as Biomedical Sciences, Biology, Computer Science, and Statistics are ongoing, and some Program faculty are affiliated with

Near Infrared Spectroscopy

the campus-wide Molecular, Cellular, & Integrative Neuroscience (MCIN) program (<https://mcin.colostate.edu>). This affiliation provides students with important opportunities to collaborate with other laboratories on campus. In addition, a colloquium series is offered each semester in which students, faculty, and outside researchers may participate.

Because many of our students pursue careers in academia, the Program promotes development of strong teaching skills. As part of the curriculum, all students obtain direct teaching experience through supervised teaching of two different undergraduate laboratory courses. In addition, the Department of Psychology administers a Teaching Fellows Program that involves the supervised instruction of General Psychology and more advanced Psychology courses. There are also opportunities for graduate students to teach lecture courses within the department during regular semester

sessions or condensed summer sessions. Students may also elect to participate in lectures, seminars, and workshops on teaching offered by the Department of Psychology, School of Education, and The Institute for Learning and Teaching (TILT).

The Cognitive Neuroscience Program offers a Doctor of Philosophy (Ph.D.) degree. A Master's (M.S.) degree is awarded, but only as part of the requirements toward attaining the Ph.D. Students seeking admission should be firmly committed to the completion of the Ph.D. The program of study is designed to be completed in four to five years; students admitted with a Master's degree in Psychology or a related discipline can expect to complete requirements for the Ph.D. in two to three years.

During the first year of study, graduate students are required to complete a two-semester sequence in Statistics (Methods of Research in Psychology I and II), as well as core courses and seminars in Cognitive Neuroscience (see specific course requirements listed below). It is expected that all course requirements will be completed during the student's first three years of graduate study.

The program is designed so students complete and defend their master's thesis by the end of their second year of graduate study. Students who successfully complete their master's thesis plus at least 32 credits of graduate coursework are granted a Master of Science (M.S.) degree in Psychology. During the third year of graduate study, students complete a comprehensive examination. Performance on the examination is used to determine if the student is prepared to continue in the program with their dissertation research. The fourth year of graduate study (and fifth, if necessary) is devoted primarily to

completion of the doctoral dissertation. The dissertation and any remaining Program, Department, and University requirements should be completed within two to three years of completion of the M.S. degree. Upon completion of all requirements, students are granted a Doctor of Philosophy (Ph.D.) degree in Psychology.

Graduate training in the program includes the following course requirements:

1. A two-semester sequence in Methods of Research in Psychology (i.e., Statistics).
2. Two core courses within Cognitive Neuroscience: Sensation and Perception, Cognitive Neuroscience, or Neuropsychology.
3. Two core courses taken from two different areas outside of Cognitive Neuroscience (e.g., Cognitive Processes & Social Psychology)
4. A third core course in Cognitive Neuroscience (other than the two used to fulfill Requirement #2) or an alternative course approved by the program (e.g., BMS545 Functional Neuroanatomy, Multivariate Analysis).
5. A minimum of four specialty seminars, with the expectation that students will enroll in a seminar each semester after their first year. The majority of content of two of the four seminars MUST concern Cognitive Neuroscience methodology (e.g., Neuroscience of Adversity, Advanced Electrophysiology & Spectral Analysis, Brain Network Analysis).
6. Ongoing enrollment in the Cognitive and Clinical Neuroscience seminar.

In addition, students who are funded by NIH, NSF or DoD grants are required to take a research ethics class. GRAD 544 is one option, but many on this list could substitute:

<https://www.research.colostate.edu/ricro/rcr/courses-and-education/>

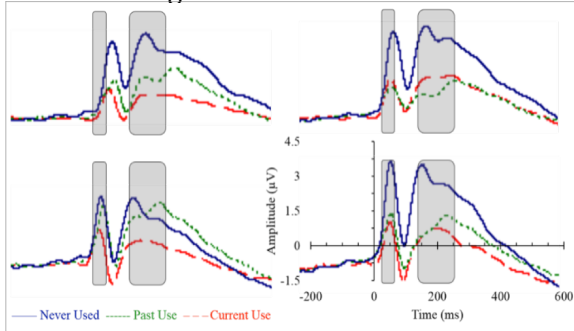

A typical course schedule is shown at the end of this document. This schedule is presented for illustrative purposes only; the specific set and sequence of courses will be tailored to each individual student's interests and training goals. For example, although students in the Program must complete two Cognitive Neuroscience core courses, the specific courses used to fulfill requirements 3, 4 and 5 will vary from student to student. Further customization is possible based on the student's selection of seminars and electives. Given the interdisciplinary nature of neuroscience, students may elect to take courses outside the Department of Psychology to further develop their specific training goals.

Research & Teaching

Students may petition Program faculty for course and requirement substitutions or waivers in order to pursue individual educational goals. In addition, courses taken at other institutions (e.g., for students entering with a master's degree) may be used to waive a course requirement if the course from the previous institution is comparable in level and content to the one taught at CSU.

Research involvement and the development of research skills are an integral part of doctoral training in the Cognitive Neuroscience Program. Students are expected to be actively involved in research each semester they are enrolled in the program. New students typically begin research projects during their first year under the close supervision of their faculty advisor and become more independent as their graduate careers progress. Research Practicum, Thesis, and Dissertation courses are the mechanism by which academic credit is given for this activity.

ERP Data-Cognitive Neuroscience

Students also develop teaching skills and get direct teaching experience via the CN Program's teaching requirement. All students are required to teach at least one semester of two different laboratory courses from our undergraduate offerings in sensation and perception, biological psychology, and cognitive neuroscience. Students in the Program are given primary responsibility for teaching the course and evaluating students but is closely supervised by a faculty member.

To promote the development of communication and presentation skills, and to encourage scholarly interaction with faculty and peers, all students are expected to participate in our monthly colloquium series during the first year of their graduate training. Credit for this activity is attained through enrollment in the course entitled Group Study: Cognitive and Clinical Neuroscience. This series provides exposure to different perspectives on the field and the opportunity to interact with professors from other departments and institutions.

An advisory committee is formed for each student in the Program and consists of the faculty advisor and two to three other faculty members. The specific structure of the committee is determined according to directives from the graduate school. The advisory committee assists the faculty advisor in guiding the student through the program and is also responsible for evaluating competency on the master's

thesis, Advancement-to-Candidacy exam, and the dissertation. In addition, Program faculty members meet and discuss progress of new students at the end of each semester during the first year. After the first year, students are evaluated on an annual basis. The purpose of these evaluations is to provide written feedback to the student regarding their performance in course work, teaching, research, and whether they are making timely progress in the Program. A formal evaluation is performed after completion of the M.S. to assure the student is a suitable candidate for doctoral study.

Students in the Program draw on the guidance, support, and expertise of faculty members in an environment providing an excellent student/ faculty ratio (2:1). Program faculty members in Cognitive Neuroscience have acquired a strong national/ international reputation. Faculty members are recipients of numerous scientific research grants funded by prestigious federal organizations including the National Institutes of Health and the National Science Foundation, as well as College and University Teaching Awards.

Faculty include:

Deana B. Davalos, Professor
Ph.D., Colorado State University, 2000.
Specialization: clinical neuroscience, temporal processing, aging and cognition, neurophysiology. Phone: 970.491.5548
Email: deana.davalos@colostate.edu

Emily Merz, Assistant Professor
Ph.D., University of Pittsburgh, 2012.
Specialization: early experience, socioeconomic factors, brain development, self-regulation, developmental psychopathology
Phone: 970.491.2317
Email: emily.merz@colostate.edu

Don C. Rojas, Professor
Ph.D., Colorado State University, 1995.
Specialization: clinical neuroscience,

neuroimaging, autism, schizophrenia,
sensory and motor processes,
biomarkers

Phone: 970.491.5213

Email: don.rojas@colostate.edu

Michael Thomas, Associate Professor
Ph.D., Arizona State University, 2011.
Specialization: neuropsychology
psychometrics, clinical neuroscience
Phone: 970.491.6820
Email: michael.thomas@colostate.edu

Dr. Deana Davalos' laboratory
investigates temporal processing, aspects of
cognitive aging, neurophysiology of aging,
and cognitive processes in clinical
populations. One line of research focuses
on understanding the development of time
processing abilities over the life span. In
particular, is there a relationship between
one's ability to process time accurately and
higher order cognitive skills?

Dr. Davalos also studies time processing in
clinical populations. Her research involves
behavioral testing, EEG/ERP, and
neuropsychological testing. She is also
Director of the Aging Clinic of the Rockies.

Dr. Emily Merz studies how children's
experiences shape their brain development.
She employs neuroimaging techniques to
study associations between socioeconomic
factors and children's brain structure and
function; the proximal factors, such as
chronic stress, that explain those
associations; and the implications of
socioeconomic differences in brain
development for cognitive and mental
health outcomes. Her goal is to contribute to
advances in practice and policy related to
childhood socioeconomic disadvantage.

Dr. Don Rojas is interested in
neurodevelopmental disorders such as
autism, fragile x syndrome and
schizophrenia. He uses a variety of
neuroimaging techniques, including MEG,
EEG, MRI and fNIRS, to examine sensory,
motor and language-related brain activity

with a focus on biomarker and
endophenotype development.

Dr. Michael Thomas Current research
seeks to better understand cognitive deficits
associated with psychosis, aging, and
dementia. We rely on methods from
psychometric theory, cognitive psychology,
and neuroscience to conduct our research.
In particular, our lab utilizes computerized
adaptive cognitive testing, functional
magnetic resonance imaging (fMRI),
electroencephalography (EEG), and
transcranial magnetic stimulation (TMS).

Research Facilities

Individual laboratories within the Cognitive
Neuroscience faculty house the following
major pieces of equipment:

- 64-channel Neuroscan Synamp2 EEG system
- 144-channel g.tec HiAmp EEG system
- NIRx NIRScout Extended near infrared spectroscopy system with 32 detectors and 48 emitters
- Magstim Super Rapid Plus high-power transcranial magnetic stimulator
- High speed eyetracking, tDCS and more!

In addition to individual research
laboratories, the Department also maintains
and coordinates several shared-use
laboratory facilities.

There is also a shared facility that includes
an additional EEG system with separate
subject-running rooms and control rooms.
The system is a 64-channel Neuroscan
Synamp2 EEG device. We also have shared-
use facilities set up to simultaneously run
multiple participants in computer-based
experiments.

Translational Medicine Institute

Program faculty and students collaborate within the larger CSU community. The Computer Science department has expertise and equipment for conducting Brain Computer Interface studies. Faculty and students also have access to a 3T Siemens Skyra MRI system located at the Translational Medicine Institute.

The Program's research facilities are located adjacent to the Cognitive Neuroscience Program faculty. The graduate student offices, faculty offices, and research laboratories are all in close proximity to each other providing further opportunity for interactions among the students and faculty.

Admissions & Funding

Admission to the Cognitive Neuroscience Program is competitive and is based on applicant's transcripts, letters of recommendation, and a statement of interest. The Cognitive Neuroscience program has suspended use of the GRE in admissions decisions. Applications are only accepted for admission to the fall semester. Students having either a bachelor's or master's degree will be considered. All students in the Cognitive Neuroscience Program are admitted with the expectation that they will work toward the Ph.D. degree. Each student will work closely with a faculty mentor throughout their graduate career and are encouraged to note in their application the faculty member(s) with whom their interests overlap.

It is the intent of the Program that students receive funding throughout their graduate training, though funding is contingent on the availability of funds and a student's timely progress in the program. Financial support comes from a variety of sources including teaching and research assistantships funded by the Department and University; research assistantships funded by government and private-sector grants to individual faculty members, and University-sponsored fellowships for outstanding students. In most cases, these assistantships provide a monthly stipend and tuition waiver. The Cognitive Neuroscience Program generally only offers full funding through the first 5 years of student progress towards a Ph.D.

Sample Schedule

Course	Credits	Course	Credits
Fall I		Spring I	
PSY652: Research Methods I	3	PSY653: Research Methods II	3
CN Core: Neuropsychology	3	CN Core: Cognitive Neuroscience	3
Seminar: Research Ethics	1	Seminar: Cognitive and Clinical Neuroscience	1
Seminar: Cognitive Neuroscience Methods	3	Thesis	1
Seminar: Cognitive and Clinical Neuroscience	1		
Fall II		Spring II	
Core course outside CN: History and Systems	3	Core course outside CN: Cognitive Psychology	3
Seminar: Cognitive and Clinical Neuroscience	1	Seminar: Cognitive and Clinical Neuroscience	1
Thesis	1	Thesis	3
Electives (optional)	1-3	Electives (optional)	1-3
Fall III		Spring III	
Core course outside CN: Neuroanatomy	4	Seminar: Cognitive and Clinical Neuroscience	1
Seminar: Cognitive and Clinical Neuroscience	1	Seminar: Cognitive Neuroscience Specialty Seminar	3
Advanced Research Practicum	3	Independent Research	3
Electives (optional)	1-3	Electives (optional)	1-3
Fall IV		Spring IV	
Seminar: Cognitive and Clinical Neuroscience	1	Seminar: Cognitive and Clinical Neuroscience	1
Dissertation	6	Dissertation	6
Electives (optional)	1-3	Electives (optional)	1-3
